- Direct/indirect index, index by Auditor's file number, daily fee sheet, daily receipts by month, mailing labels for returning documents
- Search by name code, instrument type code, Auditor's file number, grantee name, grantor name or by instrument type for a selected date range

CASE STUDY: Recorded Document Search

Situation Overview

An Auditor's office in the local government sector has a large database of scanned documents that are associated with property records and is looking for a way to easily search and retrieve new and archived documents.

The Challenge

Integrate with the county's existing third-party document management solution with Compu-Tech's recording software and provide user-friendly access to search the data without compromising speed or security.

Our Solution

This customer chose to secure the system by limiting access to within their local intranet - i.e. not available to the broader public over the internet. Even with large amounts of data, the robust capability of the IBM Power™ server allows users to scan for documents quickly and easily. The application also features a variety of sorting options including auditor's file number, book & page number, date filed, excise affidavit number, grantor / grantee, instrument & date, original auditor's file number, or tax parcel number - providing ultimate flexibility when searching through recorded documents.
